

Automatically create a version when starting the release

On this page

[Configuration](#) | [Related use cases](#)

Use case

This use case considers having a dedicated release ticket which tracks the **release process**. We will use this template to automatically **generate a Jira version** when **creating the release ticket**.

Configuration

1

Add the [Execute remote action](#) **post function** to the create transition.

2

Create remote action

Select the action to get started. Choose **Create a version**.

3

Select connection

Choose **an existing connection** to the current instance.

4

Customize your action

Set action parameters

1

Name

Choose "Copy field value from current issue" and select **Summary** as field.

2

Project key

Choose "Copy field value from current issue" and select **Project key** as field.

From the used **template**, you can retrieve the **Project ID** and/or the **Version ID** and save them in any field. For this use case, we will save the **Version ID** in the **description** field.

You can add more fields like **response body** or **parts** of it in the **Update issue fields (optional)** section.

Update issue fields (optional)

Select the field to be set.

Choose **Description**.

Set the value.

Choose **Version ID**.
