

Get started with JWT remote actions

JWT remote actions enables you to really make Jira the control center of your organization, connecting it to all your various web-based services. All web-services providing a REST API can be accessed using a remote action.

Where do I use a JWT remote action?

A JWT remote action can be executed using our [Execute remote action](#) post function configured in a Jira workflow.

Need some inspiration? Head over to our [Action templates!](#)

First steps

1

Head over to the Jira workflow you want to modify

2

Add a new post function in the desired transition

3

Choose "Execute remote action" from the post function list and follow the instructions in the documentation

If you still have questions, feel free to refer to our [support](#) team.
