

Basic text mode

The **basic text** parsing mode allows you to write **free text** and insert field codes. The text does **not** have to be enclosed in "" like in the [Advanced text mode](#).

All **field codes** will be replaced at **runtime** with the corresponding field value of the issue currently being processed.

Besides supporting **field code replacement**, the usage of **parser functions** like in the [Advanced text mode](#) is also available when placed between **two curly braces starting with a percent sign**, e.g. `%{{subtasks()}}`.

Example expressions

Parser expression	Description
This is the issue summary: <code>%{issue.summary}</code>	This example might return: This is the issue summary: JWT 3.0 wording update
Next status update needed by: <code>%{issue.dueDate}</code>	This example might return: Next status update needed by: 30.07.2020
This issue has been re-assigned to <code>%{issue.assignee}</code> .	This example might return: This issue has been re-assigned to a.grant.
The number of sub-tasks is: <code>%{{count(subtasks())}}</code>	This example returns the number of sub-tasks of the current issue, e.g. The number of sub-tasks is: 2
Tomorrow is <code>%{{dateToString({system.currentTimeMillis} + 1 * {DAY}, LOCAL, SERVER_LANG)}}</code> .	This example returns tomorrow's date , e.g. Tomorrow is 24/May/20.
While it's <code>%{system.currentTimeMillis}</code> now, it'll be <code>%{{dateTimeToString({system.currentTimeMillis} + 1 * {DAY}, LOCAL, SERVER_LANG)}}</code> in 24 hours.	This examples illustrates the parallel usage of field codes (the current date and time) and parser functions (tomorrow's date and time), e.g. While it's 29/Nov/20 8:33 AM now, it'll be 30/Nov/20 8:33 AM in 24 hours.
<code>%{{capitalizeWordsFully(trim(%{issue.summary}))}}</code>	This returns a well-formatted summary by removing leading and trailing blanks as well as capitalizing each word (only the word's first letter is upper case and the remaining letters are lower case).
