

JWT release notes 3.2.0

Release date	22 Nov 2022
Release type	NEW FEATURES IMPROVEMENTS
Highlights	Make Jira your control center - execute remote actions within your workflows

The best-rated app for Jira is no longer „just“ for Jira, thanks to remote actions.

New features

- Introducing the new [Execute remote action](#) post function.

No matter if you want to create a Jira project, create a Confluence space or page or even create a card in Trello – with the latest Jira Workflow Toolbox you can do all of this and more.

Now you can perform actions on other Atlassian applications or **any external service with a REST API**.

Eager to try it yourself? Just update your Jira Workflow Toolbox to its latest **version 3.2.0**. Here's what you can expect from **the most flexible workflow tool for Jira**.

The wizard **blocked URL** - magically create remote actions without prior knowledge

The wizard allows you to implement your **use case in three simple steps without diving into technical details**. This is your mode if you want to make things work quickly and effortlessly:

- **Select a template**
- **Choose a connection**
- **Customize your action**

It's as easy as it can get!

The action templates **blocked URL** - preconfigured for a quick start

Jira Workflow Toolbox provides you with **preconfigured action templates that will make external actions easy as can be**.

With action templates for Jira and Confluence, you're just seconds away from communicating across boundaries:

- **Create Jira projects**
- **Create Confluence spaces** and **pages**
- ... and countless more!

Plus, the pool of action templates will grow steadily. More tools will be added continuously in future releases.

Are you missing a tool or service? [Let us know!](#)

Jira Workflow Toolbox allows you to preconfigure connections and actions to **maximize efficiency and scalability**.

The expert mode **blocked URL** - anything is possible

While our wizard aims to configure everyday actions with as few clicks as possible (without having to deal with REST), **expert mode gives you full control over your actions**.

From configuring custom actions (using POST, GET, PUT, and DELETE) to setting custom parameters and editing the raw REST body in JSON format - there are no limits for experienced users.

That's how you won't have to adapt to your workflows, but **your workflows will adapt to you and your individual needs**.
