

JWT Release Notes 2.4.9

ATTENTION

This version has been removed from the Atlassian Marketplace due to major problems with calculated fields

New features

- Parser function: ***projectKey(string project_name)*** - Returns a string with the **project key** from the project with the **project_name**.

Improvements

- Show 250 fields in field code injectors (instead of 50)
- Syntax highlighting works when *Insight* is installed
- *Add a comment* post function, author field is now limited to user picker fields
- Documentation added to the parser test page and improved formatting of the parser results
- Documentation improvements for some functions

Bug fixes

- Fixed NullPointerException in function *projectCategory()*
- Workaround to prevent Lexorank Deadlock during the creation of several issues in one post function
- Removed JWT calculated field values during index operations due to major problems while calculating index dependent function while the index is not available, JWT calculated fields are no longer searchable
- Fixed problem setting *Insight* object fields
- Fixed data access problem in the *set or update a project property* function
- Fixed bug in *Field is initialized* validator when *has changed / has not changed* options were selected
