Bug fixes

- Calculated fields had been removed from the index in version 2.4.9 to prevent problems related to functions that require the index while the index is unavailable. Now the calculated fields are only removed from the index if functions are being used that require the index. e.g the function `issuesFromJQL()`
- The `isJwtTriggeredTransition()` function did not respect the issue creation when triggered by Jira Workflow Toolbox itself
- Fix in Ephemeral fields to prevent a `NullPointerException` caused by empty objects generated by the Expression Parser Test page
